Introduction

Introduction

- What is this project about?
 - Ranking people based on their influential power
- How does this project help in the real world?
 - Marketing Industry
- What are potential applications of this project?
 - Advertising, Politics, news, etc.
- What are some of the questions that this project answers?
 - Are the number of followers always proportional to the actual influence level?
 - What kind of impact will be caused if we only considered the influencer rankings by using a single factor “followership”

Problem Definition

Problem Definition

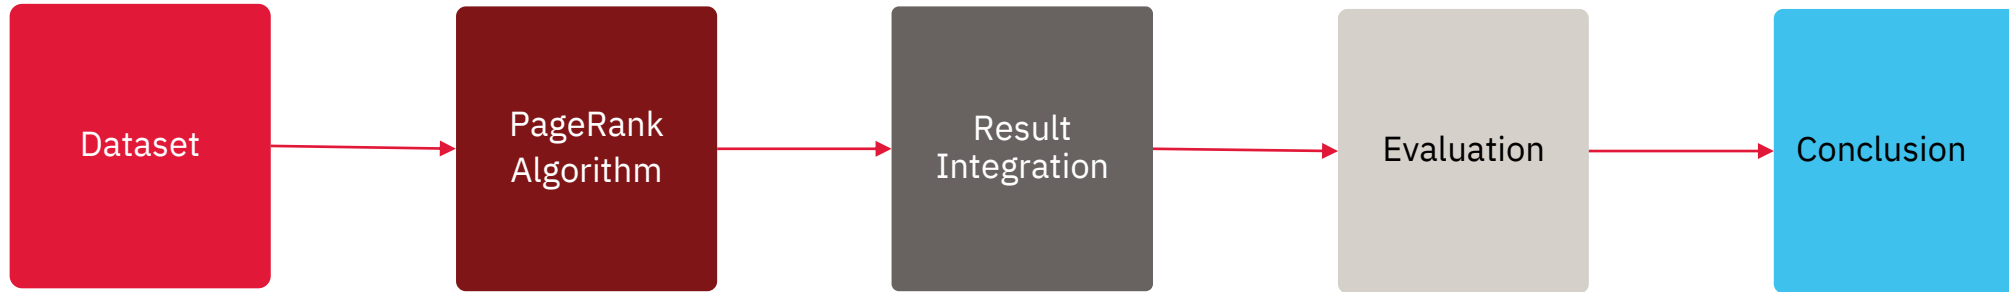

- **Problem 1:** Given a network from SNS services, rank the nodes based on their influential power.
- **Problem 2:** The influence of a user cannot be defined directly from the social network; instead, the other factors such as retweet, mention, and reply network should be considered.
- **Problem 3:** Given multiple networks, the method to integrate each network into one final result should be required.

Methodology

Framework

Methodology

› Dataset

- We chose to use a dataset called "Higgs Twitter Dataset" provided by Stanford University which is a snapshot of the Twitter network. The dataset includes Social Network (followership), Retweet Network, Reply Network and Mention Network.
- The Networks are all directed and weighted except the Social Network which is only directed.
- All user IDs have been replaced with a randomly assigned numeric ID.

Methodology

➤ PageRank Algorithm

- What does it do?
 - PageRank Algorithm ranks the nodes based on their importance.
- PageRank Algorithm from NetworkX library was applied to the 4 networks.
- Generating 4 different dictionaries.

Methodology

➤ PageRank Result Integration

- Each of the dictionaries was weighted so that they all could be integrated into one.
- The focus of this project was to check how the retweet, reply, and mention data affect to the influence ranking of the users.
- In total 3 types of weight distribution was used, each type using different weights for networks.

Methodology

➤ PageRank Result Integration

- The types are as follow:

| Type | Social Network | Mention Network | Retweet Network | Reply Network |
|------|----------------|-----------------|-----------------|---------------|
| 1 | 0.6 | 0.1 | 0.1 | 0.2 |
| 2 | 0.5 | 0.15 | 0.15 | 0.2 |
| 3 | 0.4 | 0.2 | 0.2 | 0.2 |

Evaluation

Evaluation

- Influence levels calculated using just the number of followers can possibly include influencers who are not active at the time.
- We can filter these influencers and extract the list of active influencers by considering interaction factors.

Evaluation

| Rank | Social Network | Mention Network | Retweet Network | Reply Network |
|------|----------------|-----------------|-----------------|---------------|
| 1 | 1 | 88 | 88 | 677 |
| 2 | 88 | 677 | 14454 | 88 |
| 3 | 1503 | 2417 | 677 | 220 |
| 4 | 138 | 59195 | 1988 | 3549 |
| 5 | 220 | 7533 | 283 | 317 |
| 6 | 317 | 383 | 349 | 349 |
| 7 | 206 | 3998 | 68278 | 3369 |
| 8 | 352 | 1988 | 6948 | 7690 |
| 9 | 667 | 3369 | 3571 | 1988 |
| 10 | 301 | 11792 | 3549 | 16460 |

Evaluation

| Followership | | Integrated: Type 1 | |
|--------------|---------|--------------------|---------|
| Rank | Node ID | Rank | Node ID |
| 1 | 1 | 1 | 1 |
| 2 | 88 | 2 | 88 |
| 3 | 1503 | 3 | 677 |
| 4 | 138 | 4 | 220 |
| 5 | 220 | 5 | 317 |
| 6 | 317 | 6 | 138 |
| 7 | 206 | 7 | 1988 |
| 8 | 352 | 8 | 3549 |
| 9 | 677 | 9 | 1503 |
| 10 | 301 | 10 | 206 |

13

Evaluation

| Followership | | Integrated: Type 2 | |
|--------------|---------|--------------------|---------|
| Rank | Node ID | Rank | Node ID |
| 1 | 1 | 1 | 88 |
| 2 | 88 | 2 | 1 |
| 3 | 1503 | 3 | 677 |
| 4 | 138 | 4 | 220 |
| 5 | 220 | 5 | 1988 |
| 6 | 317 | 6 | 2417 |
| 7 | 206 | 7 | 7533 |
| 8 | 352 | 8 | 138 |
| 9 | 677 | 9 | 3549 |
| 10 | 301 | 10 | 317 |

| |
|----|
| 14 |
| 15 |
| 18 |
| 19 |

| Followership | | Integrated: Type 3 | |
|--------------|---------|--------------------|---------|
| Rank | Node ID | Rank | Node ID |
| 1 | 1 | 1 | 88 |
| 2 | 88 | 2 | 677 |
| 3 | 1503 | 3 | 1 |
| 4 | 138 | 4 | 220 |
| 5 | 220 | 5 | 1988 |
| 6 | 317 | 6 | 2417 |
| 7 | 206 | 7 | 14454 |
| 8 | 352 | 8 | 7533 |
| 9 | 677 | 9 | 3549 |
| 10 | 301 | 10 | 206 |

| |
|----|
| 14 |
| 15 |
| 16 |
| 22 |
| 23 |

Conclusion

Conclusion

- Influencer rankings calculated simply using a single factor of “followership” would bring us divergent rankings from actual influence levels of users.
- We calculated more accurate rankings by using other factors as well.
- We repeatedly observed that the number of followers are not always proportional to the actual influence level.
- Followership could be used to filter out fake or inactive influencers.
- A possible future work could be about working on the weight distributions for calculation.
 - For viral marketing where the spread of information via sharing feature is the key, a higher weight on retweet factor or anything equivalent would be ideal to find the most fitting influencers.

Hope you enjoyed our presentation!
